

实验 3

3.1 流体半空间中的点源场分布（验证镜像法与波数积分方法的等价性）

图 3.1 流体半空间中的点源场分布

如上图 3.1 所示，声源位置 $(r, z_s) = (0, 25)$ m，声源频率 $f = 150$ Hz，声速 1500m/s，上表面声压为 0。波动方程如下：

球坐标系 $(\mathbf{r}_0 = (0, 0, 25))$ ：

$$\nabla^2 \psi(\mathbf{r}) + k^2 \psi(\mathbf{r}) = S_\omega \delta(\mathbf{r} - \mathbf{r}_0). \quad (1)$$

柱坐标系：

$$\left[\frac{1}{r} \frac{\partial}{\partial r} r \frac{\partial}{\partial r} + \frac{\partial^2}{\partial z^2} + k^2(z) \right] \psi(r, z) = \frac{S_\omega \delta(r) \delta(z - z_s)}{2\pi r}. \quad (2)$$

假设单位体积注入幅度 $S_\omega = 1$ 。

a. 试写出 (1) 式所对应的严格解和近似解。根据公式

$$M = \text{int} \left\{ \frac{2z_s}{\lambda} + 0.5 \right\} \quad (3)$$

预测强度极大值的数目，然后画出接收机位于深度 200m 处的传输损耗曲线，并与渐近形式 $40 \log r$ 比较，对比图中极大值数目与公式 (3) 是否一致，从图中判断传输损耗曲线的渐近形式。声源置于深度 40m 处，重复上述计算和分析。最大值数目与声源深度有无关系？

$$\text{严格解: } \psi(r, z) = A \left(\frac{e^{ikR_1}}{R_1} - \frac{e^{ikR_2}}{R_2} \right)$$

$$\text{近似解: } \psi(r, z) \approx -2iA \frac{e^{ikR}}{R} \sin(kz_s \sin \theta)$$

当 $z_s = 25$ m 时，预测极大值数目 $M = 5$

当 $z_s = 40$ m 时，预测极大值数目 $M = 8$

```

3.2 镜像法、信号处理方法理解信道响应

载波频率 $f_c = 13000$ Hz, 带宽 $B = 4882.8$ Hz, 采样频率 $F_s = B$ Hz, 发射端位于

$(r_T, z_T) = (0, 36)$ m, 接收机位于 $(r_R, z_R) = (2000, 20)$ m 处。水深 $D = 100$ m。

a. 接收机深度固定为 20m 处, 计算 $m = 0, 1, 2, 3$ 下随着接收机水平距离 r 的传输损耗。

% 3.2a

```
fc = 13000; B = 4882.8; Fs = B;
zT = 36; zR = 20; D = 100;
r_fixed = 2000;
k_c = 2*pi*fc/c;

r_vec = linspace(10, 5000, 1000);
figure;
for m = 0:3
    p_total = 0;
    for j = 0:m
        R_p = [sqrt(r_vec.^2 + (2*j*D + zR - zT).^2);
               sqrt(r_vec.^2 + (2*j*D + zR + zT).^2);
               sqrt(r_vec.^2 + (2*(j+1)*D - zR - zT).^2);
               sqrt(r_vec.^2 + (2*(j+1)*D - zR + zT).^2)];

        signs = [(-1).^j, -((-1).^j), (-1).^(j+1), -((-1).^(j+1))];
        for p = 1:4
            p_total = p_total + signs(p) * exp(1j*k_c*R_p(p,:)) ./ R_p(p,:);
        end
    end
    plot(r_vec, -20*log10(abs(p_total)), 'LineWidth', 1.2); hold on;
end
set(gca, 'YDir', 'reverse'); grid on;
xlabel('r(m)', 'FontSize', fsz); ylabel('TL(dB)', 'FontSize', fsz);
legend('m=0', 'm=1', 'm=2', 'm=3', 'FontSize', 10);
title('不同反射次数下的传输损耗曲线');
```

- b. 只考虑四条路径，即 $m=0$ ，计算 $h[n]$ ，并画出 $|h[n]|$ 。能否从 $|h[n]|$ 的局部最大值推断时延信息？若能，可否根据时延信息反推接收机位置？（假设所有其他参数已知）。

$$h[n] = \sum_{i=1}^4 A_i e^{-j2\pi f_c \tau_i} \text{sinc}\left(B\left(\frac{n}{F_s} - \tau_i\right)\right), \text{ 两个问题都可以。}$$

% 3.2b

```
R_m0 = [sqrt(r_fixed.^2 + (zR - zT).^2), sqrt(r_fixed.^2 + (zR + zT).^2), ...
        sqrt(r_fixed.^2 + (2*D - zR - zT).^2), sqrt(r_fixed.^2 + (2*D - zR + zT).^2)];
tau = R_m0 ./ c;
t_h = min(tau)-0.003 : 1/Fs : max(tau)+0.003;
h_n = zeros(size(t_h));
amp_m0 = [1, -1, 1, -1] ./ R_m0;
for i = 1:4
    h_n = h_n + amp_m0(i) .* exp(-1j.*2.*pi.*fc.*tau(i)) .* sinc((t_h - tau(i)).*Fs);
end

figure;
subplot(2,1,1);
plot(t_h.*1000, abs(h_n), 'b', 'LineWidth', lw);
xlabel('时间(ms)', 'FontSize', fsz); ylabel('|h[n]|', 'FontSize', fsz);
title('信道冲激响应幅度(m=0, r=2km)');
grid on;

subplot(2,1,2);
N_fft = 4096;
H_f = abs(fftshift(fft(h_n, N_fft)));
f_axis = linspace(-Fs/2, Fs/2, N_fft);
plot(f_axis, H_f./max(H_f), 'k', 'LineWidth', 1.2); % 归一化幅度
xlabel('频率(Hz)', 'FontSize', fsz); ylabel('幅度', 'FontSize', fsz);
title('|h[n]|的等效基带频谱');
grid on;
```

- c. 实际中很难获取绝对时延信息，只能得到相对于最短路径的时延差信息。能否根据时延差信息推断水深？（假设所有其他参数已知）

可以，由 $\tau_1 = \frac{1}{c} \sqrt{r_R^2 + (z_R - z_T)^2}$

$$\tau_3 = \tau_1 + \Delta\tau_{31}$$

$$R_3 = c\tau_3 = \sqrt{r_R^2 + (2D - z_R - z_T)^2}$$

$$(2D - z_R - z_T)^2 = (c\tau_3)^2 - r_R^2$$

$$\text{可得: } D = \frac{1}{2} \left[\sqrt{(c(\tau_1 + \Delta\tau_{31}))^2 - r_R^2} + z_R + z_T \right]$$

- d. 画出 $|h[n]|$ 的频谱。

同 3.2b
